Cover Letter

With this letter I am applying for a summer position at Neonode Inc, Stockholm.

To be part of such a highly technical company would be like a dream come true. I really want to work with a company as yourself since you are developing the technology of tomorrow and I would like to be a part of it. I am really interested in the development of touch technology and working with microcontrollers, for example I have been working with microcontrollers like Arduino before in two of my courses. I believe I would be of great use to your company since my background in Engineering physics allows me to view things from an analytical point of view from all of the mathematics and physics courses I have taken. By combining this with computer science, different projects involving engineering and physics I believe I have developed a skill-set needed to develop products in such a highly technical field. When working in a technical field, I can see that it's important to be able to work in a group, and as I've been project leader for both a project at the University to build a particle accelerator and in a project at a company through a course, I believe I have this skill set.

By coming from a background of a Motorman I see things in a more practical nature and my ability to combine both my analytical and practical knowledge is something that I think would benefit you.

Lastly I just want to add that working with you would be really exciting and a learning opportunity for me to be a part of developing the technology of the future.

I look forward to meeting you personally.

Kind regards,
Joakim Olofsson
